

This listing of claims will replace all prior versions,  
and listings, of claims in the application:

1 Claim 1 (previously presented): A communication device for  
2 use in a communications system that uses multiple tones  
3 distributed over a predetermined bandwidth to communicate  
4 data, the device comprising:

5               a mapping circuit that receives data symbols and  
6 maps the symbols to prescribed time instants in a  
7 predetermined time interval to generate a discrete signal  
8 including mapped symbols, each mapped symbol corresponding  
9 to a discrete point in time; and

10               an interpolation circuit that receives the  
11 discrete signal and generates a continuous signal by  
12 applying an interpolation function to the discrete signal,  
13 the interpolation function operating on the discrete signal  
14 such that a frequency response of the continuous signal  
15 includes sinusoids having non-zero values at a first set of  
16 tones, the first set of tones being a subset of said  
17 multiple tones, the non-zero value at each of said first  
18 set of tones being a function of a plurality of mapped  
19 symbols corresponding to different discrete points in time,  
20 the frequency response of the continuous signal also  
21 including zero values at a second set of tones, the second  
22 set of tones being different from said first set of tones  
23 and being another subset of said multiple tones.

1 Claim 2 (previously presented): The device of claim 1  
2 wherein the discrete time instants are defined within the  
3 range of 0, T/N, 2T/N, ..., T(N-1)/N, where N is a total  
4 number of time instants in the predetermined time interval.

1 Claim 3 (previously presented): The device of claim 1  
2 wherein the frequency tones within the first set of tones  
3 are contiguous frequency tones, and the prescribed time  
4 instants are equally spaced and uniformly distributed over  
5 one symbol duration.

1 Claim 4 (previously presented): The device of claim 1  
2 wherein the frequency tones within the ~~allocated tone~~ first  
3 set of tones are equally spaced frequency tones, and the  
4 prescribed time instants are equally spaced and uniformly  
5 distributed over a fraction of one symbol duration.

1 Claim 5 (previously presented): The device of claim 4  
2 wherein a fraction of one symbol duration is defined by  $1/L$   
3 where L is the spacing between two adjacent tones in the  
4 first set of tones.

1 Claim 6 (previously presented): The device of claim 1  
2 wherein a total number of discrete time instants is greater  
3 than or equal to a total number of frequency tones  
4 distributed over the predetermined bandwidth.

1 Claim 7 (previously presented): The device of claim 1  
2 wherein the interpolation circuit further includes a memory  
3 for storing the predetermined interpolation functions, and  
4 an interpolation function module for retrieving the  
5 interpolation functions from the memory and applying the  
6 interpolation functions to the discrete signal to generate  
7 the continuous signal.

1 Claim 8 (previously presented): The device of claim 7  
2 wherein the interpolation functions comprise a matrix of  
3 precomputed sinusoidal waveforms.

1 Claim 9 (previously presented): The device of claim 7  
2 wherein the interpolation functions comprise continuous  
3 interpolation functions.

1 Claim 10 (previously presented): The device of claim 1  
2 wherein the mapping circuit replicates the discrete signal  
3 of mapped symbols to generate an infinite series of mapped  
4 symbols over prescribed time instants covering a time  
5 interval from  $-\infty$  to  $+\infty$ .

1 Claim 11 (previously presented): The device of claim 10  
2 wherein the interpolation functions comprise sinc  
3 interpolation functions, and the interpolation circuit  
4 applies the sinc interpolation functions to the infinite  
5 series of mapped symbols.

1 Claim 12 (previously presented): The device of claim 1  
2 wherein the data symbols are complex symbols associated  
3 with a symbol constellation.

1 Claim 13 (previously presented): The device of claim 1  
2 further including a digital signal processor for  
3 implementing the mapping circuit and the interpolation  
4 circuit.

1 Claim 14 (previously presented): The device of claim 1  
2 wherein said interpolation circuit includes a sampling  
3 circuit for sampling the continuous signal to produce a  
4 digital signal sample vector, the device further including  
5 a cyclic prefix circuit for receiving the digital signal  
6 sample vector from the sampling circuit and prepending a  
7 cyclic prefix to the digital signal sample vector.

1 Claim 15 (previously presented): The device of claim 14  
2 wherein the cyclic prefix circuit operates to copy an end  
3 portion of the digital signal sample vector and prepend the  
4 end portion to a beginning portion of the digital signal  
5 sample vector.

1 Claim 16 (previously presented): The device of claim 1,  
2 wherein said interpolation circuit includes a sampling  
3 circuit for sampling the continuous signal to produce a  
4 digital signal sample vector, the device further including  
5 a digital to analog converter operable to receive the  
6 digital signal sample vector and generate an analog signal  
7 for transmission.

1 Claim 17 (original): A communication system for generating  
2 an OFDM signal having allocated frequency tones distributed  
3 over a predetermined bandwidth, the communication system  
4 comprising:

5 a mapping module that receives data symbols from  
6 a symbol constellation and maps the symbols to prescribed  
7 time instants in a time domain symbol duration to generate  
8 a discrete signal of mapped symbols; and

9 an interpolation module that receives the  
10 discrete signal and generates a continuous signal by  
11 applying an interpolation function to the discrete signal;  
12 wherein the interpolation function operates on  
13 the discrete signal such that a frequency response of the  
14 continuous signal includes sinusoids having non-zero values  
15 at the allocated frequency tones, and zero values at  
16 frequency tones other than the allocated frequency tones.

1 Claim 18 (original): The communication system of claim 17  
2 wherein the allocated frequency tones are associated with a  
3 designated transmitter within the communication system.

1 Claim 19 (original): The communication system of claim 17  
2 wherein the allocated frequency tones are contiguous  
3 frequency tones, and the prescribed time instants are  
4 equally spaced time instants uniformly distributed over one  
5 symbol duration.

1 Claim 20 (original): The communication system of claim 17  
2 wherein the allocated frequency tones are equally spaced  
3 frequency tones, and the prescribed time instants are  
4 equally spaced time instants uniformly distributed over a  
5 fraction of one symbol duration.

1 Claim 21 (original): The communication system of claim 20  
2 wherein a fraction of one symbol duration is defined by  $1/L$   
3 where L is the spacing between two adjacent allocated  
4 frequency tones.

1 Claim 22 (original): The communication system of claim 17  
2 wherein the interpolation function operates on the discrete  
3 signal such that values of the continuous signal at the  
4 prescribed time instants are equal to the mapped symbols.

1 Claim 23 (original): The communication system of claim 17  
2 wherein the interpolation module includes a memory for  
3 storing the interpolation function, the interpolation  
4 module retrieving the interpolation function from the  
5 memory and applying the interpolation function to the  
6 discrete signal to generate the continuous signal.

1 Claim 24 (original): The communication system of claim 23  
2 wherein the interpolation function comprises a sinc  
3 interpolation function.

1 Claim 25 (original): A communication system for generating  
2 an OFDM signal having allocated frequency tones distributed  
3 over a predetermined bandwidth, the communication system  
4 comprising:

5               a mapping module that receives data symbols from  
6 a symbol constellation and maps the symbols to prescribed  
7 time instants in a time domain symbol duration to generate  
8 a discrete signal of mapped symbols; and

9               an interpolation module that receives the  
10 discrete signal and generates a digital signal sample  
11 vector by applying an interpolation function to the  
12 discrete signal;

13               wherein the interpolation function operates on  
14 the discrete signal such that a frequency response of the  
15 digital signal sample vector includes sinusoids having non-  
16 zero values at the allocated frequency tones, and zero  
17 values at frequency tones other than the allocated  
18 frequency tones.

1 Claim 26 (original): The communication system of claim 25  
2 wherein the interpolation module further includes a memory  
3 for storing the interpolation function, the interpolation  
4 module retrieving the interpolation function from the  
5 memory and applying the interpolation function to the  
6 discrete signal to generate a digital signal sample vector.

1 Claim 27 (original): The communication system of claim 26  
2 wherein the interpolation function is a discrete

3 interpolation function comprising a matrix of precomputed  
4 sinusoidal waveforms.

1 Claim 28 (original): The communication system of claim 27  
2 wherein the interpolation module multiplies the matrix of  
3 precomputed sinusoidal waveforms with the discrete signal  
4 of mapped symbols over the time domain symbol duration to  
5 generate the digital signal sample vector.

1 Claim 29 (original): A communication system for generating  
2 an OFDM signal having allocated frequency tones distributed  
3 over a predetermined bandwidth, the communication system  
4 comprising:

5 a mapping module that receives data symbols from  
6 a symbol constellation and maps the symbols to prescribed  
7 time instants in a time domain symbol duration to generate  
8 a discrete signal of mapped symbols; and

9 an interpolation module that receives the  
10 discrete signal and generates a continuous signal by  
11 applying an interpolation function to the discrete signal;  
12 wherein the interpolation function operates on  
13 the discrete signal such that values of the continuous  
14 signal at the prescribed time instants are equal to the  
15 mapped symbols.

1 Claim 30 (original): A communication system comprising:  
2 a mapping circuit that receives data symbols and  
3 maps the symbols to prescribed time instants in a time  
4 domain symbol duration to generate a discrete signal of  
5 mapped symbols; and  
6 an interpolation circuit that receives the  
7 discrete signal and generates a continuous signal by  
8 applying an interpolation function that operates on the

9 discrete signal such that a frequency response of the  
10 continuous signal includes sinusoids having non-zero values  
11 at a first set of tones, and zero values at a second set of  
12 tones.

1 Claim 31 (previously presented): The communication system  
2 of claim 4 30 wherein the continuous signal comprises an  
3 OFDM communication signal and wherein the value of the  
4 continuous signal at each of the prescribed time instants  
5 is a function of the mapped symbol at said prescribed time  
6 instant.

1 Claim 32 (original): The communication system of claim 30  
2 wherein the first set of tones are allocated to one  
3 communication device within the communication system.

1 Claim 33 (original): The communication system of claim 32  
2 wherein the communication device comprises a transmitter.

1 Claim 34 (original): The communication system of claim 30  
2 wherein the interpolation circuit is adapted to store the  
3 interpolation function.

1 Claim 35 (original): The communication system of claim 34  
2 wherein the interpolation function is a sinc interpolation  
3 function.

1 Claim 36 (original): The communication system of claim 34  
2 wherein the interpolation function is a matrix of  
3 precomputed sinusoidal waveforms.

1 Claim 37 (original): The communication system of claim 36  
2 wherein the interpolation circuit multiplies the matrix of

3 precomputed sinusoidal waveforms with the discrete signal  
4 of mapped symbols over the time domain symbol duration to  
5 generate the continuous signal.

1 Claim 38 (original): The communication system of claim 30  
2 further comprising a sampling circuit that samples the  
3 continuous signal at discrete time instants distributed  
4 over the time domain symbol duration to generate a digital  
5 signal sample vector.

1 Claim 39 (original): The communication system of claim 38  
2 wherein the discrete time instants are defined within the  
3 range of 0, T/N, 2T/N, ..., T(N-1)/N, where N is a total  
4 number of time instants in the time domain symbol duration.

1 Claim 40 (original): The communication system of claim 30  
2 wherein the data symbols are complex symbols associated  
3 with a symbol constellation.

1 Claim 41 (original): A communication system comprising:  
2                   a mapping circuit that receives data symbols and  
3 maps the symbols to prescribed time instants in a time  
4 domain symbol duration to generate a discrete signal of  
5 mapped symbols; and  
6                   an interpolation circuit that receives the  
7 discrete signal and generates a digital signal sample  
8 vector by applying an interpolation function that operates  
9 on the discrete signal such that a frequency response of  
10 the digital signal sample vector includes sinusoids having  
11 non-zero values at a first set of tones, and zero values at  
12 a second set of tones.

1 Claim 42 (original): The communication system of claim 41  
2 wherein the interpolation circuit is adapted to store the  
3 interpolation function.

1 Claim 43 (original): The communication system of claim 42  
2 wherein the interpolation function is a matrix of  
3 precomputed sinusoidal waveforms.

1 Claim 44 (original): The communication system of claim 43  
2 wherein the interpolation circuit multiplies the matrix of  
3 precomputed sinusoidal waveforms with the discrete signal  
4 of mapped symbols over the time domain symbol duration to  
5 generate the digital signal sample vector.

Claims 45-49 (canceled)

1 Claim 50 (original): A method for reducing a peak-to-  
2 average ratio in an OFDM communication signal transmitted  
3 by a communication device, the method comprising:  
4         providing a time domain symbol duration having  
5         equally spaced time instants;  
6         allocating a predetermined number of frequency  
7         tones to the communication device;  
8         receiving as input data symbols to be transmitted  
9         by the OFDM communication signal;  
10         mapping the data symbols to the equally spaced  
11         time instants in the symbol duration to generate a discrete  
12         signal of mapped symbols;  
13         generating a continuous signal by applying an  
14         interpolation function to the discrete signal, the  
15         interpolation function operating on the discrete signal  
16         such that a frequency response of the continuous signal  
17         includes sinusoids having non-zero values at the allocated

18 frequency tones, and zero values at frequency tones other  
19 than the allocated frequency tones; and  
20 sampling the continuous signal at discrete time  
21 instants distributed over the time domain symbol duration,  
22 to generate a digital signal sample vector.

1 Claim 51 (original): The method of claim 50 wherein the  
2 discrete time instants are defined within the range of 0,  
3  $T/N, 2T/N, \dots, T(N-1)/N$ , where N is a total number of time  
4 instants in the symbol duration.

1 Claim 52 (original): The method of claim 50 wherein the  
2 step of allocating a predetermined number of frequency  
3 tones to the communication device further comprises  
4 allocating contiguous frequency tones to the communication  
5 device.

1 Claim 53 (original): The method of claim 50 wherein the  
2 step of allocating a predetermined number of frequency  
3 tones to the communication device further comprises  
4 allocating equally spaced frequency tones to the  
5 communication device.

1 Claim 54 (original): The method of claim 50 further  
2 including the step of replicating the mapped symbols within  
3 the symbol duration to generate an infinite series of data  
4 symbols over equally spaced time instants covering a time  
5 interval from  $-\infty$  to  $+\infty$  after the step of mapping the data  
6 symbols.

1 Claim 55 (original): The method of claim 54 wherein the  
2 step of generating the continuous signal further comprises

3 applying a sinc interpolation function to the infinite  
4 series of data symbols.

1 Claim 56 (original): The method of claim 50 wherein the  
2 discrete signal of mapped symbols includes odd numbered  
3 symbols and even number symbols, and further comprises the  
4 step of phase rotating each even numbered symbol by  $\pi/4$ .

1 Claim 57 (original): The method of claim 50 further  
2 comprising the step of mapping the data symbols to a block  
3 of complex data symbols wherein the block of complex data  
4 symbols includes odd numbered symbols and even numbered  
5 symbols;

6 phase rotating each even numbered symbol by  $\pi/4$ ;  
7 and

8 mapping the block of complex data symbols to  
9 equally spaced time instants in the symbol duration to  
10 generate the discrete signal of mapped symbols.

1 Claim 58 (original): The method of claim 50 further  
2 comprising the step of offsetting imaginary components of  
3 the digital signal sample vector by a predetermined number  
4 of samples for producing a cyclic offset in the digital  
5 signal sample vector.

1 Claim 59 (original): The method of claim 58 further  
2 comprising the step of fixing a position of real components  
3 of the digital signal sample vector with respect to the  
4 imaginary components.

1 Claim 60 (original): The method of claim 58 wherein the  
2 predetermined number of samples is an integer number of  
3 samples.

1 Claim 61 (original): The method of claim 58 wherein the  
2 predetermined number of samples is a fraction of one sample  
3 period.

1 Claim 62 (original): The method of claim 50 further  
2 comprising the step of prepending a cyclic prefix to the  
3 digital signal sample vector.

1 Claim 63 (original): The method of claim 62 wherein the  
2 step of prepending a cyclic prefix further comprises  
3 copying an end portion of the digital signal sample vector  
4 and prepending the end portion to a beginning portion of  
5 the digital signal sample vector.

1 Claim 64 (original): The method of claim 50 wherein the  
2 step of allocating a predetermined number of frequency  
3 tones includes allocating more tones than a total number of  
4 data symbols to be transmitted in the symbol duration.

1 Claim 65 (original): The method of claim 50 wherein the  
2 interpolation function is a raised cosine function.

1 Claim 66 (original): The method of claim 50 further  
2 comprising the step of precomputing the interpolation  
3 function and storing the interpolation function in a  
4 memory.

1 Claim 67 (original): A method for reducing a peak-to-  
2 average ratio in an OFDM communication signal having a set  
3 of tones distributed over a predetermined bandwidth, the  
4 method comprising:

5 defining a symbol duration for the OFDM  
6 communication signal;

7 defining time instants in the symbol duration;  
8 allocating frequency tones from the set of tones  
9 to a particular communication device;  
10 receiving as input data symbols from a symbol  
11 constellation, the data symbols being transmitted by the  
12 OFDM communication signal;  
13 mapping the data symbols to the time instants to  
14 generate a discrete signal in the time domain;  
15 generating a digital signal sample vector by  
16 applying interpolation functions to the discrete signal  
17 such that a frequency response of the digital signal sample  
18 vector includes sinusoids having non-zero values at  
19 allocated frequency tones, and zero values at frequency  
20 tones other than the allocated frequency tones.

1 Claim 68 (original): The method of claim 67 wherein the  
2 step of allocating frequency tones further includes  
3 allocating contiguous tones, and mapping the data symbols  
4 to equally spaced time instants distributed over one symbol  
5 duration.

1 Claim 69 (original): The method of claim 67 wherein the  
2 step of allocating frequency tones further includes  
3 allocating equally spaced tones, and mapping the data  
4 symbols to equally spaced time instants distributed over a  
5 portion of one symbol duration.

1 Claim 70 (original): The method of claim 67 wherein the  
2 data symbols are complex symbols.

1 Claim 71 (original): The method of claim 67 wherein the  
2 discrete signal includes odd numbered symbols and even

3 number symbols, and further comprises the step of phase  
4 rotating each even numbered symbol by  $\pi/4$ .

1 Claim 72 (original): The method of claim 67 further  
2 comprising the step of mapping the data symbols to a block  
3 of complex data symbols wherein the block of complex data  
4 symbols includes odd numbered symbols and even numbered  
5 symbols;

6 phase rotating each even numbered symbol by  $\pi/4$ ;  
7 and

8 mapping the block of complex data symbols to  
9 equally spaced time instants in the symbol duration to  
10 generate the discrete signal.

1 Claim 73 (original): The method of claim 67 further  
2 comprising the step of offsetting imaginary components of  
3 the digital signal sample vector by a predetermined number  
4 of samples for producing a cyclic offset in the digital  
5 signal sample vector.

1 Claim 74 (new): A communication device for use in a  
2 communications system that uses multiple tones distributed  
3 over a predetermined bandwidth to communicate data, the  
4 device comprising:

5 a mapping circuit that receives data symbols and  
6 maps the symbols to prescribed time instants in a  
7 predetermined time interval to generate a discrete signal  
8 including mapped symbols, each mapped symbol corresponding  
9 to a discrete point in time, each discrete point in time to  
10 which a symbol is mapped not overlapping a discrete point  
11 in time to which another symbol is mapped, multiple symbols  
12 being mapped to said predetermined time interval, discrete

13 points in time to which symbols are mapped having a  
14 predetermined spacing; and  
15 an interpolation circuit that receives the  
16 discrete signal and generates a continuous signal by  
17 applying an interpolation function to the discrete signal,  
18 the interpolation function operating on the discrete signal  
19 such that a frequency response of the continuous signal  
20 includes sinusoids having non-zero values at a first set of  
21 tones, the first set of tones being a subset of said  
22 multiple tones, the non-zero value at each of said first  
23 set of tones being a function of a plurality of mapped  
24 symbols corresponding to different discrete points in time,  
25 the frequency response of the continuous signal also  
26 including zero values at a second set of tones, the second  
27 set of tones being different from said first set of tones  
28 and being another subset of said multiple tones.
